

Dynamic System Property: *atis* **Feedfromness**

(Dynamic system properties are those properties that are part of the theory and describe patterns in time as change occurs within a system or between a system and its negasystem.)

Feedfromness, $f_F(\mathfrak{S}_x)$, =_{df} transmission of *storeput* to *fromput*.

$$f_F(\mathfrak{S}_x) =_{df} \sigma(\mathfrak{S}_x) \mid (\sigma: \mathbf{S}_p \times_{S_p} \mathcal{L}_C \rightarrow F_p); \text{ that is, } \sigma(x_{S_p}) = x_{F_p}$$

Feedfromness is a *system state-transition function*; such that, the state transition is defined from the product of *storeput* and the *storeput-control qualifiers* to *fromput*.
