

Dynamic System Property: *atis*Stressness

(*Dynamic system properties* are those properties that are part of the theory and describe patterns in time as change occurs within a system or between a system and its negasystem.)

Stressness, $_{ST}\mathfrak{S}$, =_{df} change of system state due to a change in negasystem state beyond certain limits.

$$_{ST}\mathfrak{S} =_{df} \Delta \mathcal{S}' > k \Vdash \Delta \mathcal{S}$$

Stressness is defined as a change in negasystem greater than a value, k , yields a change in system state.
